- **Title**

Consultation for Fever, Sore Throat, and Stuffy Nose

- **Description**

The patient, On, presented to the doctor with complaints of fever, sore throat, and stuffy nose, which started a couple of days prior to the consultation. The patient reported no prior medication use before the consultation. The fever was described as being around 104 degrees Fahrenheit (converted from "1 or more degrees 48" which is likely a misunderstanding and meant to be Celsius. 48 C is not survivable, making 104 F (40 C) the most probable interpretation).

- **Results**: *(No test results are mentioned in the conversation.)* * Temperature

~104°F (40°C) (Patient reported)

- **Overall Summary**

The patient presents with symptoms consistent with an upper respiratory infection, likely of viral etiology, but a bacterial infection cannot be ruled out. Further assessment, and potentially testing, would be required to confirm the diagnosis and guide appropriate treatment. The provided conversation is incomplete, ending mid-sentence from the doctor, so a complete assessment and conclusion are not possible.
